****NOTE:**

Justification for maintaining current design for immediate label:

The placement of the dispensing details e.g. "date, name, dosage and frequency" on the immediate label may be insuring patients to use a correct effective dose. As the category of patients covers from infants to adults, the dosing especially for infants and childrens have to be very precise. And, the label should be clear.

The dispensing label is to be firmly attached to the immediate label for several reasons:

- improving the patient's understanding of the treatment (clear and precise)
- maximising the benefits of the therapy
- enhancing compliance
- minimising adverse effects.

Due to space constraint, immediate label could not fit in the necessary information as per DRGD requirements.

Replacing the dispensing details with required labelling contents may compromise the patient's ability to use the medicine.

Hence, for information in DRGD requirements, alternatively, patients may time to time refer to the outer label for the details of "storage condition", "Product Registration Holder details", "preservatives" and statement on "keep out of reach of children", "*Jauhi daripada kanak-kanak*" and "Controlled medicine".

Every bottle is supplied with a box.
